

Importing old data

In developing migration programs or planning the migration progress -

abat is the consultancy specialist for your company.

The situation

As your competent partner, abat supports you in developing optimal and future-orientated system strategies and converting them into tailored solutions.

abat AG is your technology specialist in Germany in the integration of SAP.

Our customers and partners benefit from our 100,000 project days worth of experience in international SAP introductions and integrations.

Importing master and transaction data from old systems is decisive in importance for the successful start up of a SAP system. In addition to the creation of data import programs, the conversion process must be cleanly planned and coordinated with all participants. Another critical success factor for importing data is the cleaning up of old data.

The task

In addition to the business administration definition of the migration objects and the technical realization of the appropriate programs, an essential point is the planning and co-ordination of time-based procedures for the data migration, including organizational tasks. This includes planning for the time set to switch off old systems and, where necessary, coordinate meetings with auditors.

Its high level of integration of individual modules characterizes SAP software. This means that data inconsistencies are already checked by SAP during the migration or input process on a module-wide basis. This complex type of checking is normally not implemented to this extent in the heterogeneous systems being taken over, which means that data cleaning must usually take place in the old systems before migration occurs. The import program on the SAP side is developed with the use of standard SAP procedures and tools.

The service

abat combines long-term business management and technical consultancy know-how. As a service company for interface technology and eBusiness, you can profit from the expert knowledge of our consultants. We use the latest interface technologies and tools in the SAP R/3 sector – ALE, BAPI, IDOC, LSMW and XI are not foreign words to us.

abat supports you through all phases of the data importing process. Starting from the definition of the data objects to be imported, including field mapping, this includes the decision regarding import procedures (batch input, IDOC, BAPI, etc.) and the development of import programs, support during the steps required for planning and coordination in the organisational import process.

The development of permanent interfaces and application programming completes our range of services on offer. We have gained experience in the realization of interfaces with the XI tool from NetWeaver in several projects.

Our consultants have planned and implemented data migration in various branches. Based on this experience, we have developed a procedural model that not only takes into account the development of import programs, but also the planning and co-ordination of the individual organizational steps.

Are you looking for a high performance partner who can offer you project management, conception and realization in one? With abat, you are in the right place.

Our service is called the “Full Service” – everything from one service provider.
