

As a competent partner in the automotive industry, abat supports both medium-sized and multi-national companies in the development of optimum and future-orientated strategies and with their

abat AG is one of the leading SAP consultants in the automotive sector in Germany.

Our customers and partners profit from the experience of over 100,000 project days of international SAP introduction and integration within the automotive industry.

SAP for Automotive

whether you are a manufacturer, supplier or logistics provider -

abat is the industry expert for your company.

The market situation

Your customers expect ever improving products and services with a constantly growing range of models and increasingly shorter time periods. This is causing the classic company boundaries to disappear. Only those who are able to design their logistics chains optimally along the value-added chain, can guarantee decisive competitive advantages. To support this task, SAP has developed applications which meet the highest demands of supply chain management. In connection with the sector know-how of abat, your IT landscape is supported from the pure planning through to the implementation and optimisation.

The objective

In a highly-competitive, dynamic environment, decisions must be able to be made quickly on the basis of reliable facts and figures. The integration and the interaction of all the participants of the process have to occur smoothly and consistently. With it managers and decision makers have information to hand at all times and can act accordingly.

The integration

In order to minimise production times and reduce warehousing costs, assessments of demand must be provided at short notice, and if possible even "just-in-time". In order to do so a precise statement about warehouse stocks and reserved quantities as well as their availability at suppliers is necessary. With SAP for Automotive and abat's knowledge of the sector, all processes and inward and outward data flows are optimised and integrated.

The offer

As early as the proposal phase we support interested parties using our tried and tested procedure models, in order to create a project proposal which meets the budget and the deadline.

From pre-studies, business process analyses and feasibility studies, organisational and technical implementation through to support in production, we are able to offer competent support for all project phases according to your requirements.

This can happen on-site at your company and be extended by individually adjusted Nearshore models.

abat helps you to integrate and optimise your processes. Here we can support your complete product life-cycle: from the development, planning and production to distribution.

We have established experience in the introduction and further development of SAP logistics modules.

For example, the Integrated Product and Process Engineering (SAP iPPE) of our team has been significantly expanded, in order to be able to develop highly complex vehicles and a wide range of versions.

We can also support the technical integration of your processes across complex system landscapes with SAP NetWeaver Process Integration (PI). Connections to the internet, mobile end devices or special warehouse software also come under our area of expertise.

Our process knowledge of automobile construction allows us to be able to understand operational and system-technical conditions very quickly and align them using the SAP system.

We are dependable: offers, costs and project processing – we communicate about all these areas in an open manner.

abat provides internet integration with the SAP ERP system: analysis, conception, realisation, linking with market places, e-procurement, ENX etc.

With our "progress" introduction method in addition to ASAP from SAP, we ensure the success of your project and create our own project proposal: Resources, time and costs are therefore transparent at all times.
