

Security Hardening

Securing legacy software against cyberattacks

Do you really have the IT security of your applications under control?

- Your software applications support business-critical processes, but do you know where security gaps and vulnerabilities exist?
- Do you have complete transparency into your system architecture to implement an effective IT security strategy?
- Are you aware of the security risks in your applications caused by outdated components and legacy structures that facilitate cyberattacks?
- Would you like to identify and address vulnerabilities in your applications without having to invest directly in costly new development?

With our **SMARTsolution Security Hardening** for legacy software, you get:

- greater security for business-critical legacy systems through structured analysis and prioritized hardening measures,
- transparency regarding system architecture, components, and potential security risks,
- a sound basis for decision-making regarding security measures, modernization, or future replacement with reduced compliance and operational risks, as well as
- cost-effective protection of existing systems without the need for complex new development.

abat is a cross-industry specialist in highly available software and digital solutions. Its service portfolio includes development, secure operation, and the optimization and transformation of existing systems. A particular focus is placed on securing applications against cyberattacks, combined with the development and support of scalable cloud platforms through managed services.

Here's how we proceed:

- Analysis of the affected software application
- Identification and assessment of relevant security risks
- Technical security analysis of source code, dependencies, and configurations
- Development of a strategic security hardening concept with concrete recommendations for action

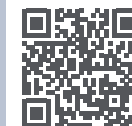

We deliver the following results:

- Provision of a software bill of materials
- Documented threat model with an overview of relevant threats and attack scenarios
- Comprehensive risk assessment taking into account technical and business implications
- Implementation-oriented security hardening concept with a prioritized catalog of measures and recommendations for suitable security tools
